2016/10/27

Contents

China **J**in**P**ing underground **L**aboratory (CJPL)

Detector Concept

Geo-Neutrinos

Other Physics

Status

CJPL: Location

□ Near Himalaya mountains.

□ Located in Sichuan, China. 2 hours drive from Xichang airport.

CJPL: Tunnel View

- ❑ Tunnel construction nearly finished. [岩土工程学报, Vol. 38 Supp. 2, 67](#)
- ❑ On average **2,400 m** rock shielding;
- ❑ 20 m * 100 m experiment hall;

CJPL: Depth & Muon Flux

Deepest:
2,400 m rock
overburden

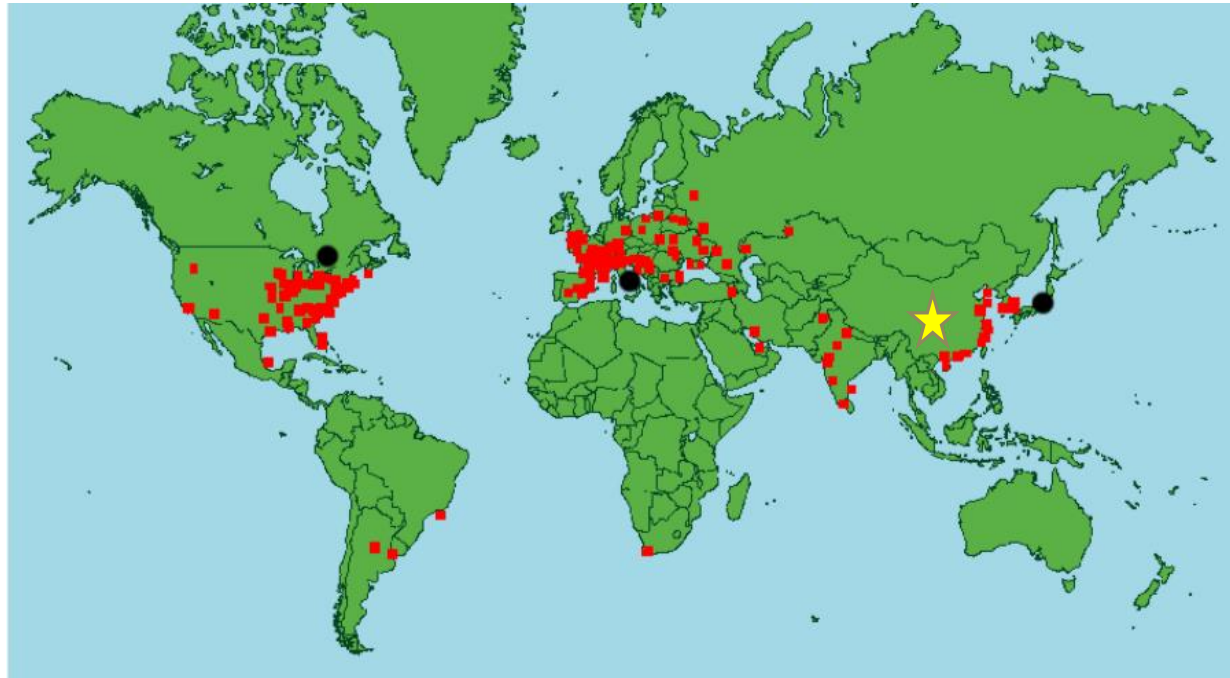

Lowest muon rate:
 $(2.0 \pm 0.4) \times 10^{-10} / (\text{cm}^2 \cdot \text{s})$

Extremely low
spallation
background

❑ Spallation induced radioactive isotopes ${}^9\text{Li}$ & ${}^8\text{He}$ are the main source of non-neutrino background for geo-neutrino detection.

CJPL: Reactor Neutrino Flux

Reactors

**Main Neutrino
Observatories**

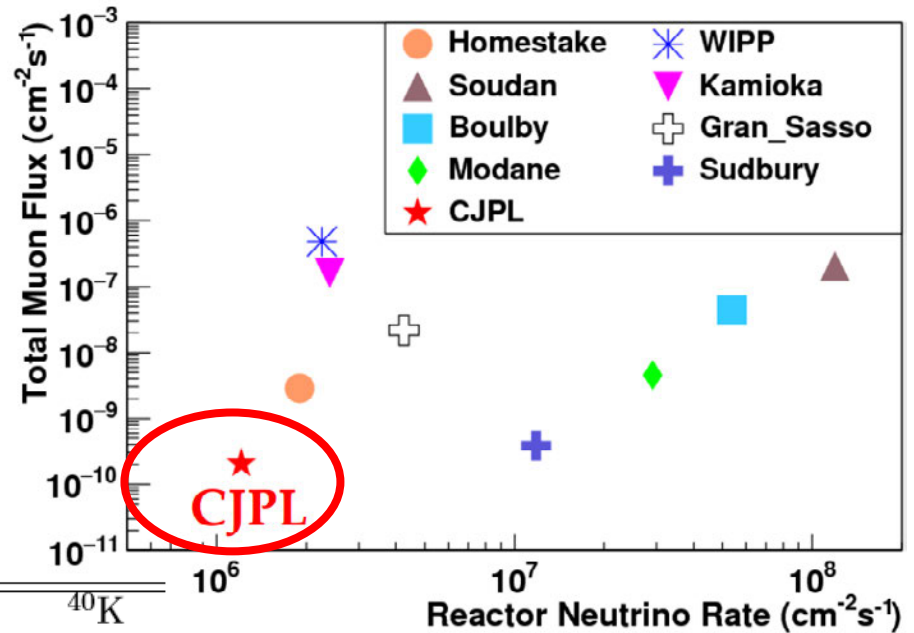

Jinping

Numerical
results later in
this talk.

- ❑ Reactor neutrinos are the dominant background overlapping with geo-neutrino energy range and signal signature.
- ❑ More than 900 km away from the nearest nuclear plant.

CJPL: A Low Background Laboratory

- Lowest muon rate;
- Lowest reactor neutrino rate.
- Lowest rock radioactivity contamination.

Site	²³⁸ U	²³² Th	⁴⁰ K
Jinping	1.8±0.2 (²²⁶ Ra)	<0.27	<1.1
Sudbury	13.7±1.6	22.6±2.1	310±40
Gran sasso hall A	116±12	12±0.4	307±8
Gran sasso hall B	7.1±1.6	0.34±0.11	7±1.7
Gran sasso hall C	11±2.3	0.37±0.13	4±1.9
Kaminoka	~12	~10	~520

Ideal place for low background experiments: dark matter search, neutrino observatory, ...

CJPL Phase I & Phase II

- ❑ CJPL I finished construction in 2010, now hosting 2 dark matter experiments: **CDEX** and **PandaX**.
- ❑ CJPL II under construction now, planning to host Jinping Neutrino Experiment as well as several other low background experiments.

Status

Neutrino Detection Technique

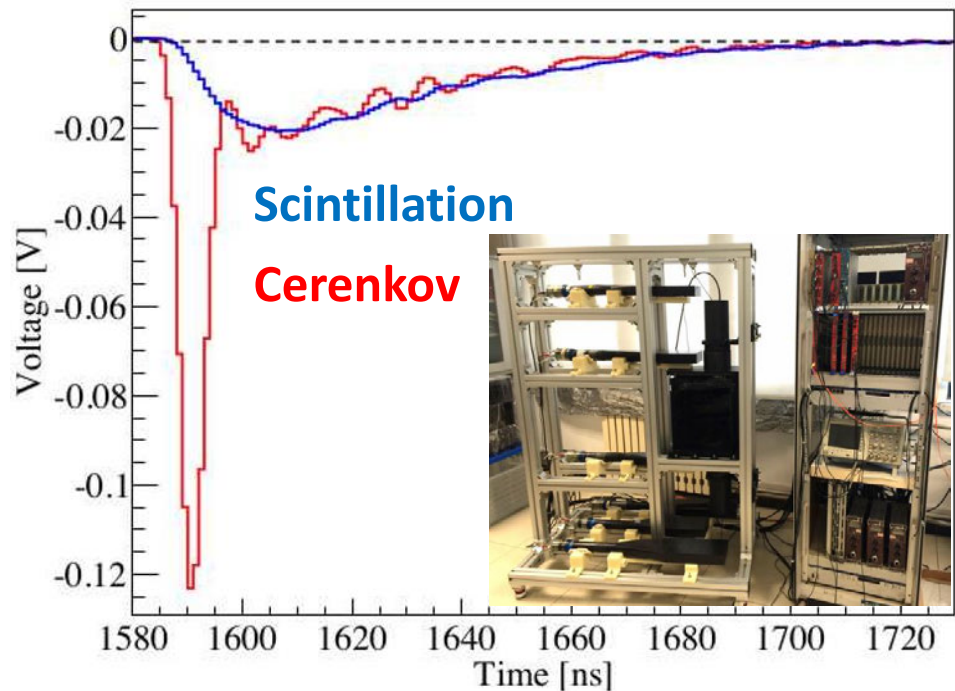

Detector Concept

- ❑ 1.5 kton×2 Fiducial for IBD
- ❑ PMT coverage >70% with self-designed light concentrator
- ❑ Energy Resolution: 500 p.e.

Slow Liquid Scintillator

- ❑ Distinguish between scintillation & Cerenkov light in time spectrum.
- ❑ Enable particle identification which suppresses fake electron background.
- ❑ Now work to improve the scintillation light yield w/o changing the timing structure.

[N. I. M Phys. Res. A 827 \(2016\) 165–170](#)

China JinPing underground Laboratory

Detector Concept

Geo-Neutrino

Other Physics

Status

Geo Neutrinos:

- ❑ Are low energy (< 3.5 MeV) $\bar{\nu}_e$'s from natural radioactivity emitted by U/Th/K heat producing elements.
- ❑ Provide constrain on Earth's thermal budget with geo neutrino measured radiogenic earth heat.
- ❑ Can be detected via IBD reaction.

TNU:

To get avoid of the redundant conversion of target mass / live time etc..

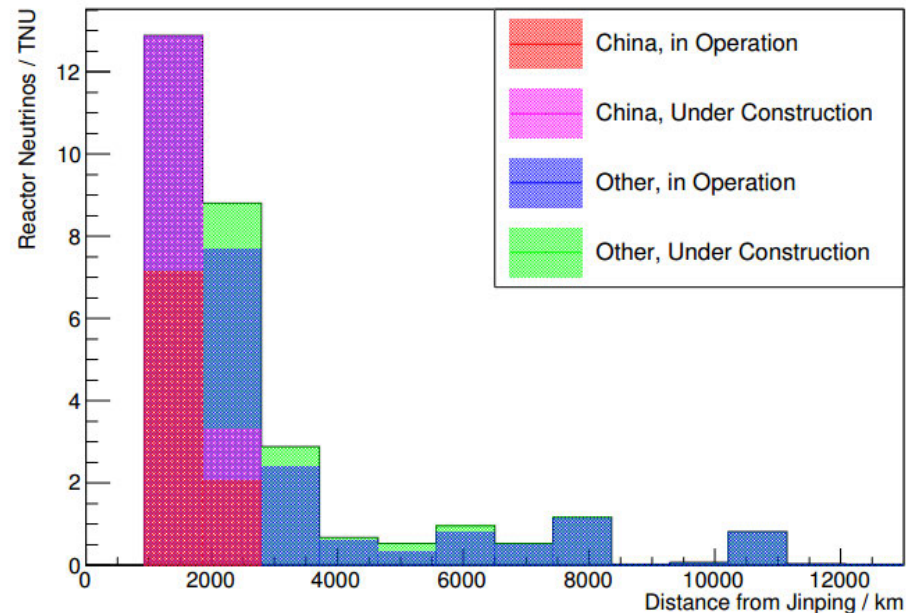

1 TNU = 1 event / 10^{32} protons / 365 days.

Reactor Neutrino Background

- ❑ SER: Signal Energy Region overlapping with geo neutrino (1.8 ~ 3.3 MeV)
- ❑ Reactor neutrino background in Jinping mainly come from reactors in coastal China.

[IAEA 2016](#)

Reactors neutrino contribution from around the world

Event Rate (TNU)	Constructed		Under Construction		Total
	China	Others	China	Others	
FER	9.2	11.1	6.6	2.1	29.0
SER	2.4	2.4	1.7	0.6	7.1

Non-Neutrino Background

☐ ${}^9\text{Li}$ & ${}^8\text{He}$

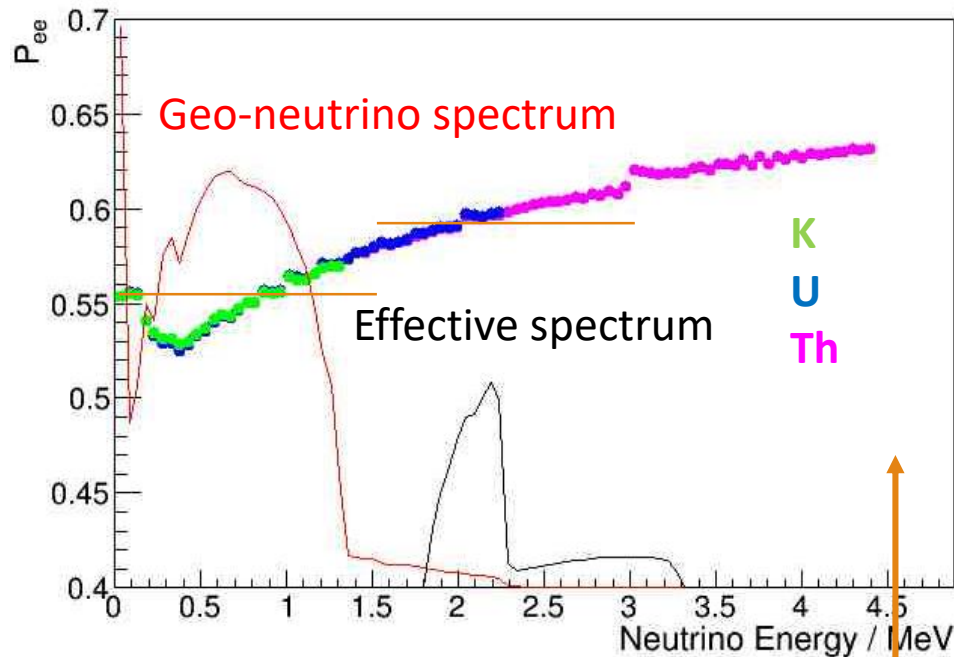

The extremely low muon rate $(2.0 \pm 0.4) \times 10^{-10} / (\text{cm}^2 \cdot \text{s})$ gives much lower spallation background compared to other experiments. This background is estimated to be **< 0.1 event / 3 kton / 1,500 days** in Jinping.

☐ (α, n) reaction

This background is closely related to the level of ${}^{210}\text{Po}$ contamination inside the tank. Assuming same level purity as Borexino, we estimate this background to be **1.7 event / 3 kton / 1,500 days** in Jinping.

Comparing with the dominant reactor neutrino background (**61.3 events / 3 kton / 1,500 days**), the above non-neutrino background are not taken into consideration in following analysis.

Geo-Neutrino Oscillation

- In the present estimation of geo-neutrino flux at Jinping, P_{ee} is employed as an overall parameter 0.553.

[Sci. Rep. 6, 33034 \(2016\)](#)

- This overall parameter simplification is corrected by oscillation analysis in prediction, giving a 7% difference.

$$\phi(i) = \frac{X \lambda N_A}{\mu} n_\nu \int \int \int \frac{A(\vec{r}') \rho(\vec{r}')}{4\pi |\vec{r}' - \vec{r}|^2} P_{ee} d\vec{r}'.$$

Electron neutrino survival probability

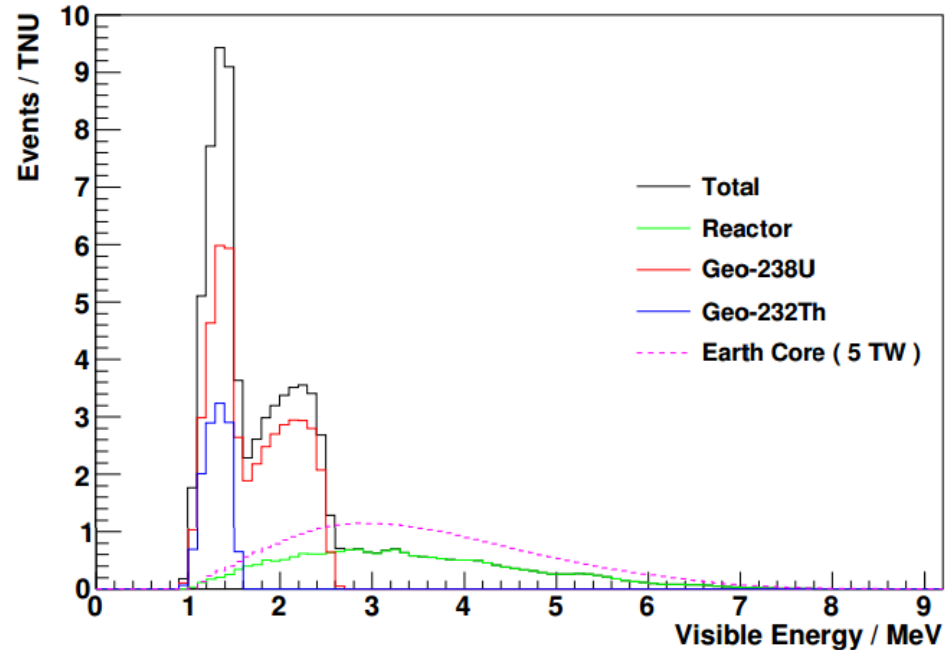

Uncertainty Estimation in Geo-Neutrino Flux Prediction

Source		Uncertainty
Crustal HPE Modeling		*12%
Oscillation	Vacuum parameter	<1%
	MSW oscillation	<1%
Predicted detection precision in Jinping		8%

[* Sci. Rep. 6, 33034 \(2016\)](#)

Prediction: IBD Events at Jinping

- ❑ 500 p.e. energy resolution
- ❑ The calculation of geo neutrino signal will be covered in Sramek's talk.
- ❑ Signal/Background ratio > 8 in SER.

	Geo-neutrino			Reactor	
	^{238}U	^{232}Th	Total	FER	SER
Rate / TNU	47.0	11.5	58.5	29.0	7.1

Predicted Sensitivity: With Fixed Th/U Ratio

- ❑ With a **fixed Th/U ratio** in accordance with theoretical assumption (3.9),
- ❑ And a **free reactor flux** parameter,
- ❑ sensitivity for geo-neutrinos reaches **4%**. (statistical, 1σ)

Live time: 3.0 kton, 1,500 days
Energy resolution: 500 p.e.

Predicted Sensitivity: With Free Th/U Ratio

- ❑ With free Th/U ratio,
- ❑ sensitivity for geo neutrino reaches **8%**. (statistical, 1σ)
- ❑ Precision of U/Th ratio measurement reaches **25%**. (statistical, 1σ)

Live time: 3.0 kton, 1,500 days
Energy resolution: 500 p.e.

Timeline

2014: CJPL II started construction

2015: Proposal for Jinping Neutrino Experiment

2016: Letter of Intent: Jinping Neutrino Experiment

1-ton prototype underway **Now here!**

[ArXiv:1602.01733](https://arxiv.org/abs/1602.01733)

2018: 10-ton prototype planned

...

Conclusion

1. Experiment setup

- ❖ 2,400 m rock shielding
- ❖ 2 kton * 2 liquid scintillator
- ❖ Lowest reactor neutrino background and muon rate

2. Geo-Neutrinos

- ❖ 4% (8%) precise measurement of geo neutrino flux for fixed (free) U/Th ratio
- ❖ 25% sensitivity for U/Th ratio

3. Status

- ❖ Now working on 1 ton prototype.
- ❖ Welcoming collaborating!

Thank you!

2015 Workshop of Jinping Neutrino Program

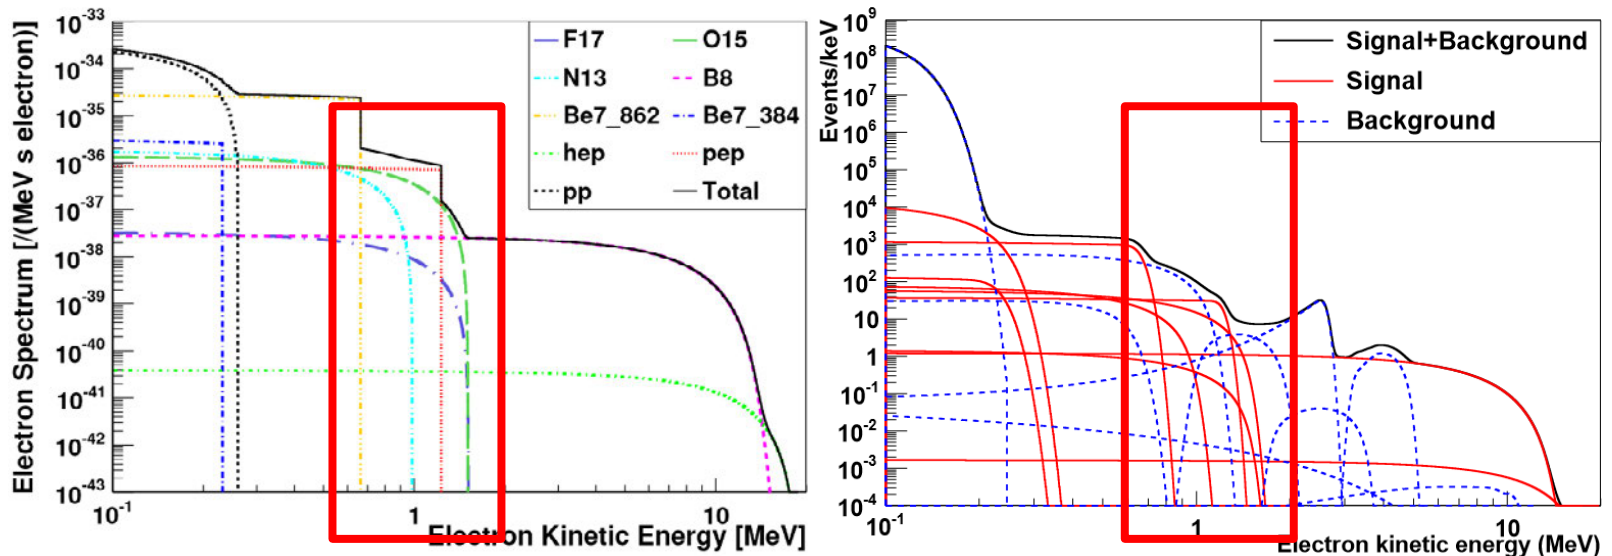

Backup: Discussion of MSW

- ❑ With lower energy, the MSW effect become smaller;
- ❑ For 3~3.5 MeV, i.e., the maximum of geo-neutrino energy, the MSW oscillation effect is around 1%.

Solar Neutrinos: Signal & Background

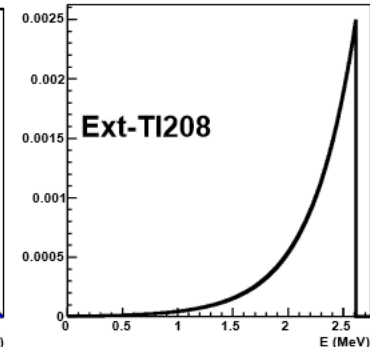

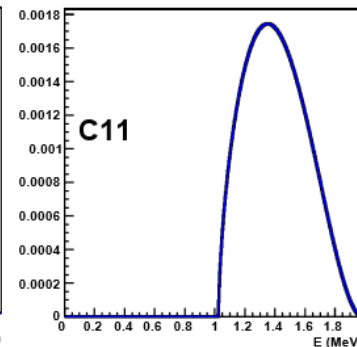

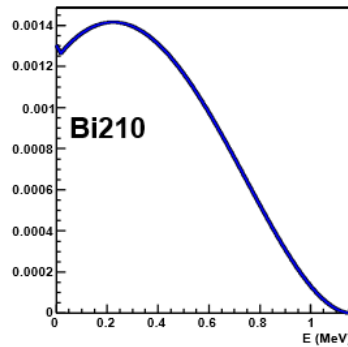

- ❑ Main background from radioactivity in scintillator, PMT glass, surrounding environment and muon induced isotopes.
- ❑ Backgrounds are estimated using Borexino or SNO result.

Solar Neutrinos: Numerical Result

	Neutrino component	Energy resolution		
		200 PE/MeV	500 PE/MeV	1000 PE/MeV
Fiducial mass 2,000 ton	pp	0.01	0.005	0.004
	${}^7\text{Be}$	0.005	0.004	0.004
	pep	0.06	0.03	0.03
	${}^{13}\text{N}$	0.4	0.3	0.2 (0.3)
	${}^{15}\text{O}$	0.2	0.1	0.08 (0.1)
	${}^8\text{B}$	0.02	0.02	0.02

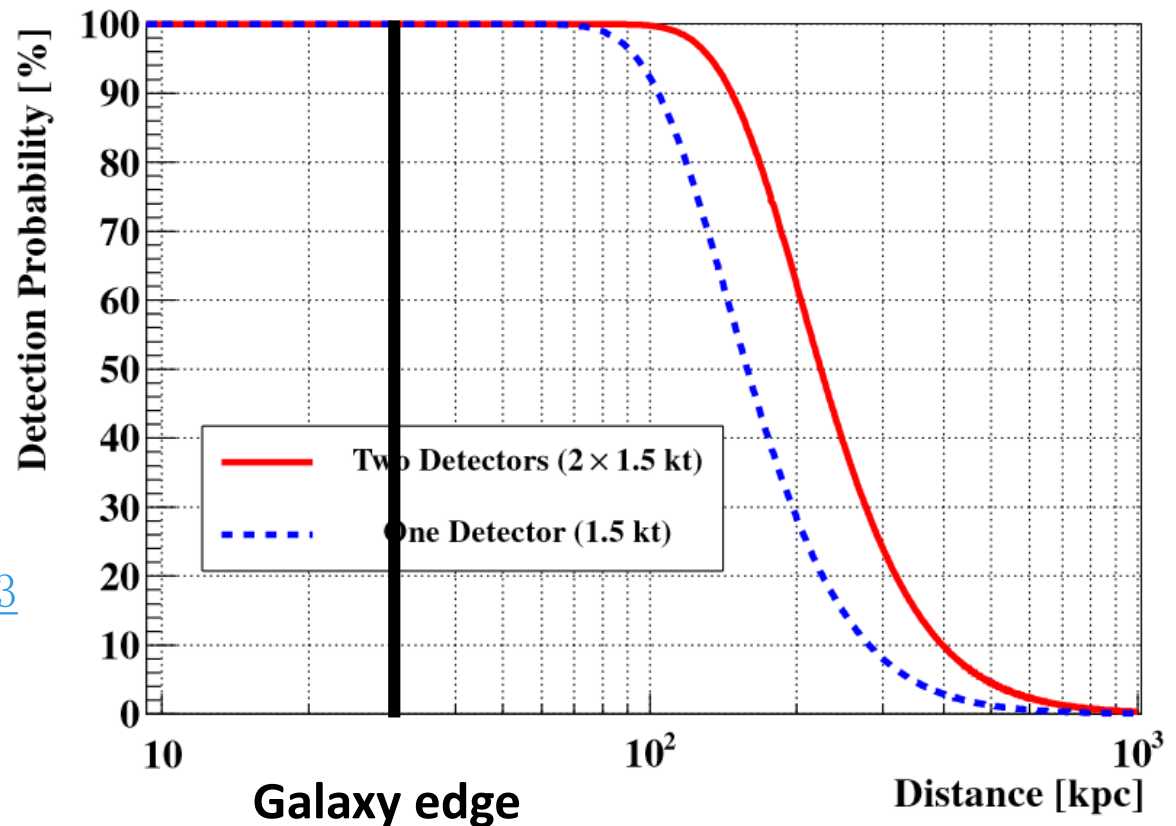

- ☐ Mainly influenced by Bi210, C11(muon induced), and External TI208.

Supernova Burst Neutrino

Double detector coincidence reduces the wrong alarm rates.

[ArXiv:1602.01733](https://arxiv.org/abs/1602.01733)

Supernova Relic Neutrino

With
scintillation/Cerenkov
distinguish technique,
backgrounds will be
greatly suppressed.
